Additional availability questions	
Is there any period of time that the process/asset is more important?	
Please take into consideration that in some cases process/asset are more important at certain times (e.g. at month-, quarter-, year closure, etc.) resulting in higher availability scores than the generic (daily) use.	YES NO
Recovery Point Objective (RPO)	
In the event of an emergency how much data is allowed to be lost. This is expressed in the Recovery Point Objective (RPO) a unit of time in minutes/hours/days. (e.g. a RPO of four hours means that at most only the data that was processed in the last four hours prior to the time the incident is lost. All the data before that time has to be processed and should be backed-up and ready for restore.	
Recovery Time Objective (RTO)	
In the event of an emergency how long may it take to execute the recovery of the IT environment. We mean that the recovery is executed with restoring the system and recovering the data lost, but not yet resulting in an operational system. This is expressed in Recovery Time Objective (RTO) in a unit of time in minutes/hours/days. (e.g. an eight hour RTO means that the environment should be restored completely within eight hours. The recovery could go faster, but eight hours is the agreed upper limit)	
Work Recovery Time (WRT)	
In the event of an emergency how much time is allowed for the verification of the restored system and/or data integrity. This is expressed in the Work Recovery Time (WRT). This could include the verification of the databases, logs, services and server connections making sure the applications are running and are available. When all systems affected by the disaster are verified and/or recovered, the environment is ready to resume the production again. Just like the RPO/RTO the WRT is expressed in a unit of time in minutes/hours/days.	
Maximum Tolerable Downtime (MTD)	
In the event of an emergency what is the maximum allowable time that the business process can be disrupted without causing any unacceptable consequences before returning to 100% normal operations). MTD = RTO + WRT	

Perform risk assessments
In the event that multiple processes and applications have similar scores you have to determine the priority between them. The best way to do that is to perform risk assessments.

# Business Criticality	
Is the asset, based upon the CIA score, business critical? (If two scores are medium (2) or one is high (3), the answer should be Yes)	
Please validate the above by answering the below mentioned question. Do failures in the application and/or service result in: Widespread unavailability of business with significant EBITA impact; Risk to human health/environment; Public, widespread damage to the reputation of the Randstad Group Company; Direct impact on EBITA; Direct negative customer satisfaction; Compliance violation; Non-public damage to organization's reputation. If any answers are applicable, your Randstad Group Company needs to classify the asset as business critical.	
# Business Criticality Score	
Check if the results from the calculated outcome based upon the CIA score and the verification question are equal.	

# Internet/web facing	
Is the IT asset accessible via the internet (also known as 'web facing')?	Yes No
